Daily operational report

demo-vps-01 | 2026-01-14

Timezone: America/Argentina/Buenos_Aires
Generated: 2026-01-15T10:30:00Z

Summary

Fictional sample: a short CPU peak coincided with background work. Disk usage reached 91% and returned to 68.5% after cleanup. The worker restarted once after an OOM exit. This text is authored for the demo; no model was called.

Source coverage

Source	State	Records
Host	Available	720
Events	Available	17
PostgreSQL	Available	1

Events describe activity; a quiet day does not prove full coverage. PostgreSQL is a point-in-time capture; cumulative counters are not daily deltas.

Host coverage: 100% (720/720 intervals of 120 s). Largest gap: 120 s. Coverage sufficient.

Findings

High - Disk threshold crossed and recovered

Usage exceeded the 90% threshold. Later samples were below the 80% recovery threshold.

Evidence: host:disk, event:disk-recovery

Medium - Worker restarted once

The fictional worker exited with code 137 and then restarted.

Evidence: event:worker-exit

Recommendations

Medium - Review the orders query plan before adding an index

Compare representative plans and cardinalities; cumulative query timings do not prove a daily regression.

Evidence: postgres:101
